Verification record

Beta 0.3.0 | 24 October 2026 | DAW plug-in-only release

This report records actual checks and their limits. A successful build or smoke test is not product certification, a listening-panel evaluation, or proof of compatibility with every DAW.

Check	Recorded result
Local DSP core	PASS: compiled with GCC / C++17 and executed in this session.
Sample rates	22.05, 44.1, 48, 96 and 192 kHz exercised in core tests.
Core checks	Unity defaults; EQ boost/cut response; compression reduction; stereo link; rapid parameter changes; finite bounded output; tail/reset behaviour; Signalsmith processing.
Shell scripts	PASS: bash syntax checks for the launcher and package/DMG scripts.
Mac CI	PASS: universal AU/VST3 compile and 2/2 CTest. Initial packaging failed; architecture-check command corrected and packaging is being retried.
Windows CI	PASS: x64 VST3 compile, 2/2 CTest, and artifact upload.

Audit corrections

Removed the standalone target and app payload. Corrected JUCE 8 licensing to AGPLv3. Replaced generated lettering with real interface text. Retained source and dependency notices. Package scripts check for both AU and VST3 executables and verify universal architecture before packaging.

Scope and remaining checks

Native processor checks

The supplied processor suite exercises 44.1/48/96 kHz, oversized and zero-length buffers, limiter output bounds, reset, latency-aligned dry/default/bypass comparisons, stereo polarity and parameter/animation-state round-trip. Platform CI determines whether this suite passes on that platform.

Mac installer validation

The workflow builds AU/VST3, runs CTest, checks arm64 and x86_64 executables with lipo, applies/verifies ad-hoc signatures, builds a package, checks its payload for both plug-ins, creates a compressed DMG and runs hdiutil verify. Apple auval is a separate gate before artifact upload.

Remaining release limitations

Developer ID signing and notarization are not performed. Representative DAW session tests, real-device playback, comparative listening, CPU profiling, extended leak testing, intersample-peak measurement and a broad host automation suite remain separate acceptance work. No AAX or Pro Tools support is included.

Upstream integration status

Signalsmith Stretch and Linear are integrated. Airwindows, Dragonfly, ChowMultiTool, ZL Equalizer and ZL Compressor are not ported in this beta. Current EQ, dynamics, saturation and reverb are original implementations; no sonic equivalence or endorsement is claimed.

Traceability

Source commit: fed9cf5f4004e27cae540d66c5946282d210ce5d
Build run: https://github.com/trendyspenders-hub/IRSauce/actions/runs/40120947562
JUCE: 8.0.6. Dependency pins are in UPSTREAM.md.
